

EZ TRIM NICKEL GAP INSTALLATION INSTRUCTIONS

6" Nickel Gap 21/32" x 5-7/8"
448 pieces per unit

8" Nickel Gap 21/32" x 7-7/8"
320 pieces per unit

- Use for interior wall and ceiling panels in 21/32" thickness and 16' lengths
- Works with contemporary and country design options

EZ Trim can be applied directly to studs or over sheet rock

(Please check local building and fire codes to ensure requirements are met when applying directly to the studs)

1. Let EZ Trim acclimate before installation. EZ Trim, like all wood products, should be conditioned to an indoor environment 48 hours before installation. Upon delivery, stack EZ Trim on runners or 2x4's above and off of the garage floor and protect from outdoor elements.
2. If applying to sheet rock, mark stud location for nailing or you can apply with construction adhesive (i.e. liquid nails, PL or Loctite) running beads using 16" spacing.
3. Applying directly to studs use 15 gauge or higher brad nails.
4. Properly setting the first piece will ensure a uniform application and the desired result. Measure from the ceiling down to the top edge of the board in several places to ensure proper alignment before nailing.
5. Because this is an interior product and not subject to moisture, setting the first piece with the flange up will allow nailing into the flange and eliminate the need for filling and repairing nail holes.
6. In runs longer than 16', stagger the second row so end joints do not line up.
7. If applying vertically, add furring strips to the studs every 24", again, nailing in the nailing flange closest to the furring strip will eliminate the need to repair nail holes in the face.
8. If face nailing is required, filling the holes with painter's putty or a light spackle will reduce nail holes from showing up in the finished wall.
